SEHAT LEDGER

Zakat Capital Preserved Through Preventive Care

An offline-first clinical screening tool & outcome-gated impact ledger for the Ummah.

Presented by Active Bengaluru Foundation

Algorism ■ 001 — Bengaluru, July 2026

The Crisis: Leaking Zakat Capital

Late-Stage Care Consumes All

Community Zakat and Sadaqah funds are overwhelmed by late-stage diabetic and hypertensive complications.

- Dialysis: ■1,58,880 per patient/year
- Cardiovascular events & stroke
- Blindness & diabetic foot amputations

These are entirely preventable at a screening cost of just ■12–15.

The Zakat Preservation Math

Funding 1 Dialysis Patient for 1 Year
(■1,58,880 in community support)

EQUALS

10,600 to 13,200

Preventive Screenings

By identifying high-risk cases early and guiding them to primary care, we prevent organ failure and preserve community capital.

The Solution: Sehat Ledger PWA

1. Offline-First

Built for the field:

• Works in basement prayer
halls with zero cellular signal.
• Local-first: writes data to
localStorage immediately.
• Zero framework overhead:
~125 KB payload, loads natively.
• No app store blockages:
installed directly via browser.

2. Vision Capture

Empowering volunteers:

• OCR via Gemini API reads
glucometers & BP screens.
• Eliminates transcription &
manual typing errors.
• Clean visual confirmation
on a simple handset camera.
• Graceful fallback to manual
when offline or keyless.

3. Secure Cloud Sync

Scale & Reliability:

• Direct PostgREST integration
syncs to Supabase cloud.
• Conflict resolution using
last-write-wins merging.
• Secure Row-Level Security
(RLS) protecting patient records.
• Synchronizes silently when
network status restores.

AI Powering the Care Loop

Structured AI Workflow

1. Vision API (Gemini-Flash)

Reads medical monitors. Refuses to guess rather than record bad clinical values.

2. Multilingual Referral (Translation)

Translates medical guidance into Urdu, Kannada, Hindi, or Tamil, tailored to patient.

3. Follow-Up Agent

Conversational AI that chats with patients, identifies barriers, and guides them to care.

Barrier Resolution Agent Demo

Patient barrier: "Clinic closed when I finish work"

Agent message:

"Assalamu Alaikum, we saw you had high blood pressure. Did you visit the Namma Clinic?"

Patient: "No, I finish work late at 7 PM."

Agent resolves: Suggests the Evening Clinic (open till 8 PM)

Instead of repeating the same referral, the agent addresses the specific barrier (distance, timing, cost) to close the loop.

The Ledger: Outcome-Gated Zakat Preservation

Strict Impact Attribution

We do NOT claim credit for:

✗ Screenings performed
✗ High-risk cases flagged
✗ Referral slips printed

We ONLY claim credit when:

✓ Patient confirms they visited clinic
✓ First-line treatment is started

Conservative Discounting:

Every projection is discounted by 50% to ensure the final numbers shown to the mosque treasurer are completely defensible.

Preserved Zakat Metrics

Accumulated deferred care burden:

■ 15,800 +

Preserved Zakat Capital

Pathways Gated:

- Renal Failure avoided: ■ 3,575 / patient
- Cardiac Complications avoided: ■ 2,160
- Stroke Pathway avoided: ■ 1,980
- Diabetic Foot avoided: ■ 900
- Diabetic Vision loss avoided: ■ 1,260

Attribution model uses local health-cost parameters from ABF field studies in Bangalore.

Sehat Ledger: The Vision

Low-Cost, High-Scale

Volunteers with ■7,000 Android phones become preventive health workers. No expensive devices or setups required.

Complete Closed Loop

AI does not just flag risk — it navigates patients around barriers, completes the referral, and validates the health outcome.

Measurable Zakat preservation

Turns mosque charity from late-stage bills to highly leveraged prevention.

Tech Highlights

- 100% Offline-First PWA
- Vanilla ES6 (No build step)
- 125 KB payload
- Supabase Sync via plain REST
- Gemini Vision & LLMs
- Privacy-First Design
- 57 Unit Tests (0 dependencies)
